

Help is Needed

Women that are pregnant and that live in rural areas such as Nepal and other women that live in the mountains are in need of help while being pregnant. When somebody is giving birth to a baby without help from somebody that is a doctor and without a system of barriers is painful. Without the attention and without resources for women that are pregnant or for the new born is not anywhere close to the people that live in rural areas. The poor quality of health care for women is very low. Having a group of Doctors help out women have their baby's be born with the proper nutrition would be a big relief for a mother. Not only would a baby have the proper nutrition, but also a mother would not die while giving birth.

Women that live in rural areas do not have any help at all besides having faith that they will live and that their baby will live too. Women suffer without the help of a doctor, barriers, and the attention of help. If we didn't have a doctor, barriers, and the attention of help, how do you think the world or the United States would be right now? Obviously the population would be low and because of that there would be much affected all over the world, but not only the world would suffer, but also mothers that lost their baby.

Women suffer after giving birth to a baby and later the baby couldn't live much longer because it did not have the right nutrition or it was not having good care. The worst case is where the baby and the mother die. If women in the world or women from

the United States did not have any help while being pregnant then just about all of us would not be here alive because our mothers did not have any help while being pregnant. How do you think women that have lost their baby's feel right now? Everybody should live happily! If we are happy right now then why can't women that live in rural places be happy too? Why can't they live happy with their baby's? Women that are pregnant should not be invisible. They should have a lot of care while being pregnant. Having a doctor help out somebody pregnant would help prevent a lot of things such as: a mother dying while giving birth, a baby dying in the womb of the mother, a baby dying while being born and much more. Nobody should be invisible especially women that are pregnant. Women that are pregnant should be the ones to be the least invisible. Women should have the attention of a doctor while being pregnant and especially when they live in rural places that are not close to being sanitary. A doctor can help prevent anybody to have a baby die or to have a mother die. A doctor has the right tools and equipment to use to help somebody that is expecting a baby. A doctor can help the baby be healthy and while the baby is in the womb the doctor can tell whether the baby is in need of anything to be healthy and without any birth problems that later could be a problem.

If women don't have the help of a doctor then there aren't any barriers, equipment, and data. Health system barriers are very important because it gives you a lot of information that you need to help a baby be healthy and to have the baby survive. Health barriers give and record information on how the baby is doing. Women in Nepal think that pain killers are of a help for themselves and for their baby, but really that is just a sign that you have failed and with the barriers you can prevent the sign of fail by knowing ahead of time with the barriers. We have a plus with barriers because that way

we know when the baby is in need of help while being in the mothers' womb.

Women that live in Nepal have no idea if their baby is healthy, they do not know if their baby is in need of something so that it would not die, or if the expectant mother is in need of anything so that she wouldn't die while having the baby. The barriers give information and hold data for several factors, including confusion in definition and terminology, recording of birth, weight and other difficulties. Barriers are very helpful to an expectant mother. An expectant mother that lives in Nepal would be considered lucky if her baby is born healthy without any problems, if the mother is healthy after having her baby and if her baby lives to grow up.

An expectant mother that lives in Nepal has to go through the hard way which having the help of nobody while giving birth or at least some help from family members, but that is not the same as having a doctor by you helping you and telling what to do. If an expectant mother does not have any family members to help her it's even worst. If an expectant mother can barely live while having the baby in the womb then how would she do it when it is time for the baby to be born? An expectant mother needs help and needs the attention from a doctor or any other professional to have her baby without having any problems. Women that are pregnant need help than to go through pain when it is suppose to be something great something that is a miracle. Doctors can be of a lot of help for a mother that is expecting a baby.

What do you think? Do pregnant women need help? Women that live in Nepal are over 200 times more likely to die. Around the world there has been over half a million women die because of pregnancy delivery. It has been estimated that over 32,000 children die each year in Nepal during the first month of life, with over two-third of these dying during the first week. We need to do something in order to stop such drastic things. The government from Nepal, Africa, and Guatemala has to think about pregnant women that are in need of help. These rural areas have to improve in the need of helping pregnant women, childbirth, and newborns. Women shouldn't suffer while being pregnant. Help is needed in rural places, such as Nepal. With the help of doctors a lot can change in Nepal. Women should not suffer because of the fact that they could not have their baby. A baby should not die because his mother died while giving birth. After having birth when a mother sees her baby die there is no way back in order to solve the problem that caused her baby to die. Doctors can help prevent having a baby or a mother die. Women in Nepal should not die while giving birth and babies should not die. Help is needed in Nepal.
